Java Full Stack Engineer | Microservices | Spring Boot | IAM / SailPoint

PROFESSIONAL SUMMARY

MCA-qualified Java Full Stack Developer with nearly 2 years of hands-on experience designing and delivering cloud-native, microservices-based applications using Java, Spring Boot, and REST APIs. Proven track record in IAM automation, event-driven architecture, secure backend development, and database optimization. Experienced working in Agile environments with cross-functional stakeholders to ship quality products on schedule. Committed to SOLID principles, 12-factor app design, and secure coding practices.

TECHNICAL SKILLS

- **Backend:** Java (Core & Advanced), Spring Boot, Spring Security, Spring MVC, J2EE
- **Architecture:** Microservices architecture, event-driven design, RESTful API development
- **Messaging & IAM:** Apache Kafka (messaging & streaming), Pub/Sub patterns, SailPoint (IAM)
- **Persistence:** JPA, Hibernate, JDBC, SQL (MySQL, Oracle, MS SQL), NoSQL (MongoDB concepts)
- **Frontend:** React.js, Angular (basic), HTML5, CSS3, JavaScript — responsive dashboards
- **Testing & QA:** JUnit, Mockito, TDD/BDD practices, SailPoint log-based debugging
- **Tools & Cloud:** Git, REST API integrations, cloud-based deployment, HL7/CDA standards
- **Foundations:** Data Structures, Algorithms, OOP, SOLID principles, Design Patterns, 12-factor app, secure coding, GenAI / GitHub Copilot
- **Soft Skills:** Agile/Scrum, multi-stakeholder collaboration, analytical thinking, written & verbal communication

PROFESSIONAL EXPERIENCE

Associate Engineer — Java & IAM | Iconma

June 2024 – January 2026

- Architected and delivered Spring Boot microservices to facilitate seamless RESTful communication between the SailPoint IAM platform and downstream enterprise applications, improving integration reliability.
- Designed and implemented custom Java-based rules, workflows, and provisioning policies within SailPoint to automate the full user lifecycle (Joiner-Mover-Leaver), cutting manual provisioning time by 40%.
- Built event-driven integrations leveraging REST APIs and SailPoint connectors to ensure real-time identity synchronization across enterprise systems — applying messaging and streaming concepts aligned with Kafka/Pub-Sub patterns.
- Optimized complex SQL queries and relational schema design in MySQL to achieve high-speed retrieval of identity data and audit logs, improving query performance for large-scale identity datasets.
- Developed a responsive internal dashboard (HTML, CSS, JavaScript / React components) enabling department heads to track access requests and certification statuses in real time.
- Streamlined the Access Certification process through automated certification configuration, achieving 100% compliance with SOX audit requirements and organizational security policies.
- Performed root cause analysis on production identity-synchronization incidents using Java debugging and SailPoint logs, resolving critical access issues within defined SLAs.
- Collaborated with business stakeholders and security teams in an Agile delivery model to gather requirements, estimate effort, and deliver sprint deliverables on schedule.
- Applied secure coding practices, OOP design patterns, and SOLID principles throughout the codebase; leveraged GenAI tools (GitHub Copilot) to accelerate development cycles.

ACADEMIC PROJECTS

CDA Generation & Integration for Health Information Exchange — Cloud-Based

- Architected a cloud-based Health Information Exchange (HIE) system for automated generation and integration of HL7 CDA documents, ensuring secure, structured exchange of clinical records.

- Developed a robust Java backend to parse complex clinical data into standardized XML formats, enabling interoperability between disparate healthcare providers using REST API integrations via SailPoint.
- Designed a secure SQL database schema to manage document metadata and patient longitudinal records with high integrity; leveraged cloud infrastructure for scalable, real-time access with strict privacy protocols.

Privacy Protection-Based Access Control Scheme in Cloud Services

- Built a secure access control framework for cloud environments using Java and SQL, implementing advanced cryptographic techniques to prevent unauthorized data exposure while maintaining data accessibility.
- Integrated a dynamic Role-Based Access Control (RBAC) system to manage multi-user permissions efficiently; optimized backend queries for high performance and low latency during authentication — directly applicable to 12-factor and cloud-native design patterns.
- Applied secure coding practices throughout Java backend and SQL credential management, including comprehensive audit logging for compliance and traceability.

CERTIFICATIONS

- Java Full Stack Developer Certification
- AI Upskilling Certificate: Technical Foundation — Qualcomm Academy
- CRT Training Certification — Infosys BPM

EDUCATION

Master of Computer Applications (MCA)

R.G. Kedia College of Commerce

November 2024

Bachelor of Computer Applications (BCA)

Masterji Degree and PG College

June 2022
